3

CASE-BASED REASONING (CBR) SYSTEM DEVELOPMENT

Student Name	Don Marco M. Sison Jeremy Prince Millan
Section:	AN#42
Professor:	Ms. Crisola G. Tan
Date:	30/09/2026

I. BACKGROUND INFORMATION

Case-Based Reasoning (CBR) is an intelligent problem-solving approach used in **Knowledge Representation and Reasoning (KRR)**. Instead of relying solely on predefined rules, CBR systems solve new problems by referring to past experiences, also known as cases. These cases contain previous problems and their successful solutions. When a new situation arises, the system identifies the most similar past case, adapts the old solution to fit the new context, and applies it. Afterward, the new case is saved, allowing the system to learn and continuously improve.

CBR is widely used in various fields, such as disaster response, legal assistance, and intelligent tutoring, because it mimics how humans naturally make decisions. For example, emergency responders rely on past typhoon data to plan evacuations; lawyers examine previous legal cases to build arguments; and tutoring systems look at prior student mistakes to provide customized guidance. In all these examples, past knowledge becomes the foundation for solving future problems more effectively.

This activity allows students to experience how CBR works by developing a simple, functional CBR program based on real-world scenarios. Through pair programming, students will learn how to represent cases, implement similarity assessment, adapt solutions, and store new learning experiences—reflecting the complete CBR cycle. This hands-on approach strengthens understanding of how intelligent systems use experiential knowledge to support reasoning, decision-making, and learning.

II. TECHNICAL ASSESSMENT

CASE-BASED REASONING (CBR) SYSTEM DEVELOPMENT

Objective

At the end of this laboratory activity, students are expected to:

1. **Understand and apply the Case-Based Reasoning (CBR) cycle**, including retrieval, reuse, revision, and retention.
2. **Represent cases effectively** using appropriate data structures such as dictionaries, arrays, JSON objects, or classes.
3. **Implement a similarity assessment method** to identify relevant past cases based on defined attributes.
4. **Adapt retrieved solutions** to meet the needs of a new problem scenario based on the chosen case study.
5. **Demonstrate learning in CBR** by saving the newly solved case into the system's case base.
6. **Develop collaboration skills** through pair programming and joint problem analysis.
7. **Apply knowledge representation and reasoning concepts** to real-world problems in disaster response, legal reasoning, or intelligent tutoring.

Materials Needed

1. Hardware
    - A laptop or desktop computer
    - Stable internet connection (for research, documentation, submission)
2. Software

A programming environment:

- Python (recommended: IDLE, VS Code, Jupyter Notebook, PyCharm)
- Any text editor (Notepad++, Sublime, VS Code) if needed

3. File Formats & Tools

Word processor for documentation:

- MS Word, Google Docs, or LibreOffice
- Screenshot tool (e.g., Snipping Tool, Lightshot, Print Screen)

4. Reference Materials

Lecture notes on:

- Knowledge Representation & Reasoning
- Case-Based Reasoning cycle
- Similarity measures

Provided case studies (Disaster DSS, Legal DSS, Intelligent Tutoring System)

5. Pair Collaboration Tools (optional but useful)
    - Google Drive for shared documentation
    - GitHub/GitLab for code collaboration

General Instructions

1. This **Technical Assessment (TA3)** must be completed by Pair.
2. Please ensure that you are grouped as pairs in the People tab.
3. Select only one case study from the list below.
4. Include clear comments in your code to describe its logic.
5. Each program should display the correct input, process, and output.
6. Ensure that your script displays clear and readable outputs.
7. Compile all Python codes and corresponding outputs into one PDF file.
8. Save it as **TA3_lastname1_lastname2.pdf**
   (Example: TA2_Patilano_Loverez.pdf)
9. Submit the **python file** and **PDF** file.

📌 Step-by-Step Instructions

1. Form a pair

Choose a partner. Each pair will work collaboratively on research, coding, debugging, and presenting your results.

2. Choose ONE (1) case study

Select only one case study from the list below. Your program must be based on the scenario and logic of the chosen system:

Case Study Options:

1. *Disaster Response Decision Support System (DSS)*
2. *AI-Based Legal Decision Support System*
3. *Intelligent Tutoring System (ITS)*

3. Define your case base

Create at least **3–5 past cases** stored as dictionaries, JSON objects, arrays, or any structure.

Example structure:

```
{
  "problem": {...},
  "solution": {...}
}
```

4. Implement similarity assessment

Your program must include a way to measure similarity between the new case and past cases. Examples:

- Attribute matching
- Weighted scoring
- Simple rule-based comparison

Output should show: (sample)

✓ Similarity score or ranking

✓ The most relevant past case retrieved

5. Adapt the solution

Modify the retrieved solution so it fits the new problem scenario.
This part should reflect the logic of your chosen case study:

Examples:

- **DSS:** Adjust evacuation plans based on population size
- **Legal DSS:** Modify arguments due to new digital evidence
- **ITS:** Give personalized feedback based on student errors

6. Demonstrate learning (retain stage)

After generating a final solution, store the new case into your case base.

Your program must show:

✓ "New case saved" or similar confirmation

✓ Updated case list

7. Display clear program outputs

Your output must include:

- New problem description

- Retrieved similar case
- Adapted final solution
- Updated case base

8. Submission Requirements

Submit the following:

A. Program File

- Python

B. Short Documentation (1–2 pages)

Include:

- Title of chosen case study
- Description of your case base
- Explanation of similarity method
- Adaptation logic
- Screenshots of program execution

C. Pair Reflection (5–7 sentences)

Discuss:

- What each partner contributed
- What challenges you encountered
- What you learned about CBR

Case Studies:

Case Study 1: Disaster Response Decision Support System

A CBR-based DSS helps local government units respond to natural disasters.

- Past cases include typhoons, floods, and earthquakes.
- New event: *Typhoon with expected flooding in urban areas.*
- System retrieves similar events: *Typhoon Ursula (2019)* and *Typhoon Odette (2021)*.
- It adapts recommended responses such as evacuation strategy, resource allocation, and shelter capacity.
- After execution, the system stores new outcomes for improved future reasoning.

Learning Outcome:

CBR helps governments respond faster by using *experiential knowledge* rather than rebuilding decisions from scratch.

Case Study 2: AI-Based Legal Decision Support System

A legal CBR tool assists lawyers by retrieving previous court cases similar to the current legal issue.

Scenario:

Client is charged with "theft involving electronic transfer." System retrieves past cases involving:

- online theft
- digital fraud
- unauthorized bank transfers

Adaptation:

The reasoning engine adjusts argument patterns to match the new technical context.

Learning:

After final verdict, the case is stored—enhancing the system's knowledge for future cybercrime-related offenses.
Case Study 3: Intelligent Tutoring System
A CBR system identifies the learning struggles of students. Student submits a math solution with repeated errors. System retrieves past students with similar error patterns (e.g., misusing formulas). It adapts feedback and personalized lessons based on successful interventions. **Learning:** System improves by retaining new student profiles and outcomes.

Your Code - Laboratory Tasks ⇩

We chose Case Study 3: Intelligent Tutoring System
A CBR system identifies the learning struggles of students.
Student submits a math solution with repeated errors.
System retrieves past students with similar error patterns (e.g., misusing formulas).
It adapts feedback and personalized lessons based on successful interventions.
Learning:
System improves by retaining new student profiles and outcomes.

- Title of chosen case study
- Description of your case base
- Explanation of similarity method
- Adaptation logic
- Screenshots of program execution

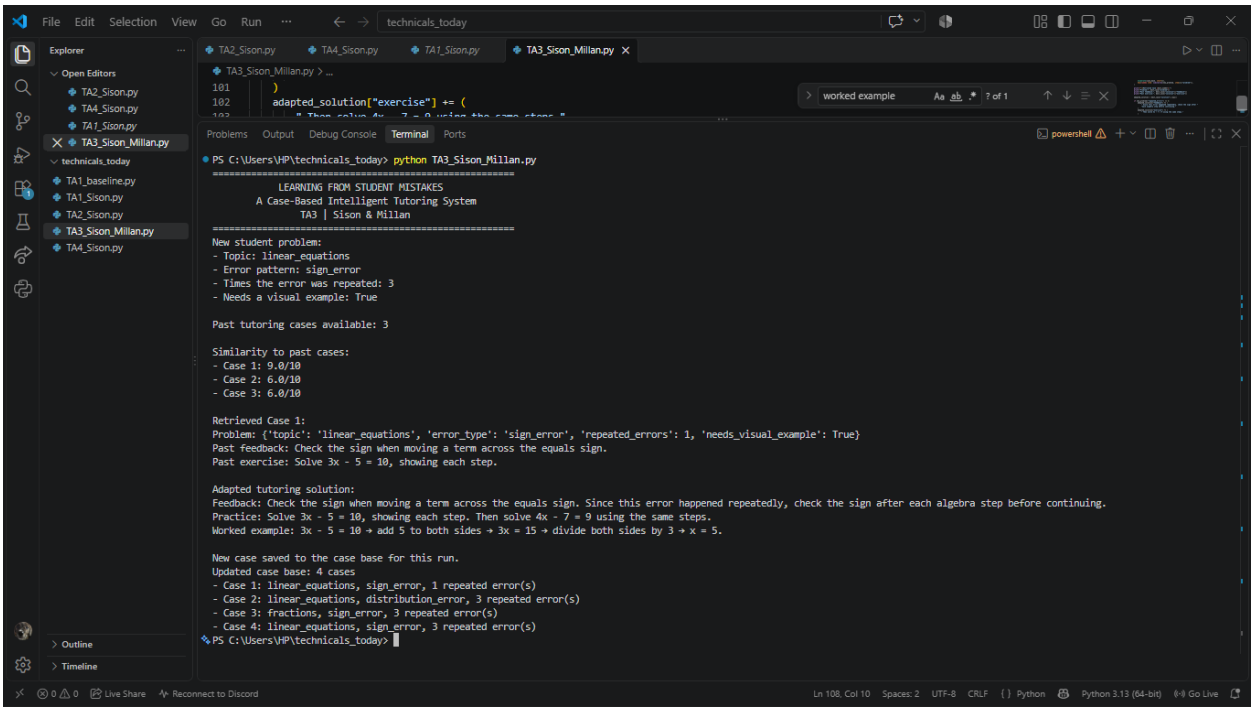

Title: Learning From Student Mistakes
An intelligent Tutoring System Using Case-Based Reasoning

Description of our Case base: Our program utilizes the use of case-based reasoning to suggest tutoring feedback for a student who repeatedly makes a sign error in linear equations. The case base begins with three past tutoring cases where each case records the mathematical math topic with an error type and its number of repeated errors, whether a worked example is needed with a solution containing feedback and practice exercises. This is where the new student problem involves linear equations with a sign error that is repeated three times along with its need for a worked example.

Explanation of the Similarity method: Our program compares a new problem with each past case by using a score out of 10 where a matching topic receives three points, a matching error type receives four points, and a matching need for an example receives a single point. This similarity in the number of repeated errors contributes up to 2 points where the farther apart the counts are, the fewer points they'll receive. With the runs we've conducted, case 1 score a 9.0/10, while cases 2 and 3 scored 6.0/10. The program retrieved case 1 as a result.

Adaptation logic: Once the program copies Case 1's feedback and exercises show the way that it adapts them to the new student problem. For the record, the student repeated the error three times since our program adds a reminder to check signs after each algebraic step and provides a second practice equations. A student needs examples so our program does that provided steps on solving an equation like 3x – 5 = 10. With that, our programs add new problems and adapts solutions as case 4 displays the updated case base which addition lasts for the current run for it restarts the program and restores them to the original three cases.

Screenshot for proof and program execution:

We chose this intelligent tutoring system because I believe that this one is the easiest after finishing activity #4 due to its similarities with the activity. Millan and Sison were able to contribute to the python program by researching and confirming it with A.I as a means to check if the program works well as intelligent tutoring system as we've encountered difficulties and problems that could've made us change cases. However, it does give us the opportunity to learn that case-based reasoning compares new problems with past cases and adapts the closest solution instead of using it unchanged. This is also thanks to our thesis regarding the algorithms put to good use when adding a case during a run while it does not preserve it after restarting the program unless we save the case base to a file.
